U  
Dear Sirs,

I am very concerned about two of your approvals in recent years of ~~BT~~ ~~BT~~ ~~BT~~ given without adequate research and follow up and both could have potential dire consequences. First is the allowing of rBGH. I support docket # 98P 1194, calling for the removal of rBGH. In the meantime, milk should be labeled as to whether or not it comes from cows given rBGH. Secondly, I'm concerned about the genetically altered "foods" that, again, are sold without labeling, though probably most of the corn & potatoes would have to carry the label. In a small study, one researcher found that animals fed altered foods had deformed offspring. Why have no large studies been done? Also, what is being done to keep these alterations within bounds? What about the organic growers who depend upon BT? Do you really think insects will not develop an immunity to BT?

I used to consider the FDA the agency that provided safeguards for us. Now, it seems to be listening more to huge corporations. I hope my trust can be restored in the future.

Sincerely,

Patricia Heberly

98P-1194
